APRIL 1982

Vol. 3, No. 4

The new products do not stop with the hardware. There is a new release of OS 65U. This version is much better documented than any in the past, and it contains many enhancements such as terminal independence, common variables, print spooler (for hard disk machines only), extended input and lower to upper case translation.

MACCM finally joined the ranks o

finally joined the ranks of the real computer manufacturers with an entire line of business oriented microcomputers which are professionally styled, engineered and documented to replace the older OSI business computers which looked like erector sets. The C-200 (table top) and C-300 (rack mounted) computers have been designed to have the greatest number of common parts as possible. There is only one chassis and only one power supply thereby eliminating the past problems when a customer wants to upgrade. All computers with the three chip (now two) CPU card will be configured and THINGS I DID TO MY OSI C4P-MF

by: Cyrus N. Wells 1405 Lucilee Street Las Vegas, NV 89101

The power supply problem seems to be inadequate heat dissipation by the rectifier di-odes. I removed the diodes from the regulator boards, which needed quite a bit of Dull-appearing clean-up. (burned) solder was removed and the cleaned joints re-soldered. The rectifier diodes were replaced by 12 Amp rectifiers mounted on an isolated heat sink and wired to the original regulator pads.

I was forced to repair the power supplies by the appearance of alternating light and dark bands slowly moving up the video screen. I finally recognized these as "hum bars" from the old T.V. days. In the T.V., they were usually caused by leaky rectifier fil-ter capacitors. Replacing the rectifier diodes as in para-graph 1 cured that problem. I believe that the bars were caused by the poor solder connections on the regulator boards. It would appear that one power supply was still rectifying full-wave while one of the rectifiers in the other supply developed an open connection. I found, and cor-rected, the burned solder problem before I had reasoned out the "hum bar" cause, so I couldn't verify my theory with a 'scope' I do know that it permanently cured the problem.

When I purchased my C4P-MF (April 80) the prices were about to go up so I also bought another 527 memory board with 8K memory installed. When I worked on the power supplies I rewired them so one supply was connected to the backplane 5-volt bus and served the CPU and video boards. The original 24K mem-

ory board was powered by a INTERFACING THE OKIDATA 82A 3-pin connector on the side of PRINTER TO THE OHIO SCIENTIFIC the board and was isolated from the backplane bus. ÷. T. paralleled a connector to the added memory board thinking it also was isolated. I later found a jumper on the added memory board tying it to the backplane bus. No harm done, but, to maintain the isola-tion, an added memory board should be checked for this jumper.

After reading the review of the D & N Micro Products 'Disk Switch' in MICRO #40, I ordered It went together the kit. easily and operates exactly as advertised. I am using double-sided disks which, by running the disks in reversed directions, is causing wear not planned for in the disk design. By turning off the drive motor when the disk is not being accessed, I am sure the wear is minimized. Incidentally, I have about 25 disks I have double-sided and I have had no problems caused. by the doubling. The only disk failures in almost years were a single-sided disk that picked up an abrasive somewhere and one disk I double-sided that would not initialize on the second side.

It is not difficult to relo-cate the 'reset' button from the <BREAK> key to the upper left corner of the keyboard panel since it is wired to a seperate connector on the CPU board. Simply locate the two wires and extend them to a pushbutton normally-open switch. I also removed the SYNC, VIDEO, COLOR and BIAS pots from the video board and epoxied them to a flat metal bar, screw-slot up. I mounted the bar under a line of four appropriately-spaced holes near the 'reset' switch and extended the connections with a piece of ribbon cable. Particularly when changing T.V. monitors (I spent several months using T.V.s in motel rooms), it makes a sometimes unreadable screen usable without taking the computer apart.

two additional By running wires I was able to install a audio transistorized small amplifier and speaker in the disk drive case. The necessary 12 volts comes from the disk power supply and a volume control/switch mounted on the rear panel with the speaker, controls the audio. A single pole-double throw switch on the computer rear panel selects the DAC or audio output.

ClP

by: Steve Hendrix 415 S. Pierce Enid, OK 73701

Since Ohio Scientific doesn't provide a printer for the ClP, I have tried several ways to give my system some way to make hard copies of my pro-grams and data. Most regrams and data. Most re-cently, I added the Okidata 82A printer. This article gives a very simple way to connect the printer with no active components, and is us-The able on other systems. only requirement is a serial port at TTL levels, like the one provided by the M6850 in the cassette interface. Ι will close with some comments on the printer itself.

The 82A printer includes both a parallel and a serial port. Since I added a parallel port to my ClP some time back, I planned to use that for the printer. However, I could not find a connector to mate with the one on the printer. much for plan Al Bu So But the serial port should be a snap -I've used the cassette port as a serial port before. Just before I put the power on it, I took one last look at the printer manual, which probably saved some burned integrated circuits. The serial port on the printer is at RS-232 levels (-12 volts to +12 volts), but the computer's serial interface is at TTL levels (0 volts to +5 volts). So much for plan B!

Guessing that the serial signal had to get to TTL levels sooner or later, I started browsing around the circuit board in the printer. Lo and behold, an 8251. This is functionally almost identical to the M6850 in the cassette port on the CIP. All that is needed is a line from the Transmit-Data line on the M6850 to the Receive-Data line on the 8251. On the ClP, tie the line to pin 10 of U18. On other systems, use pin 6 of an M6850, or pin 19 of an 8251. On the plug for the serial port of the printer, tie this line to pin 3. Figure 1 shows the patch on the printer circuit board to convert this data line to TTL levels. Τt involves cutting the line from the plug to a buffer and the line from that buffer to the 8251, and replacing the connection with a jumper directly from the plug to the 8251.

2

÷.

-

1

÷.

- 1 ¹

With this line and a ground connected (pin 7 on the print-er to the minus side of the ClP's five volt power supply), the ClP can send data to the printer. However, it has no way to detect a "printer busy" condition, which can be caused by running out of paper or sending data faster than the printer can print it. Supervisory Send Data The (SSD) line on the printer (pin 11 on the serial port) is pulled low to indicate that the printer cannot accept data. The Clear To Send line on the M6850 on the ClP is designed to sense this condition, so the solution looks simple - but again, the printer works with RS-232 levels and the ClP uses TTL levels. Figure 2 shows two alternate ways of clamping the voltage to the allowable range at the ClP.

With this interface, you can send data to the printer by typing SAVE (or POKE 517,255). Anything which appears on the screen will also go to the printer. To stop output to the printer, type LOAD (or POKE 517,0). If you are using a disk operating system such as OS65D or HEXDOS, simply PRINT or LIST to the device number designated for the cassette port. To use the control functions, PRINT CHR\$ (X);, where X is the decimal value for the desired function from the table on page 68 of the printer manual.

The first time you try to list a long program, you will prob-ably become very impatient with the 300 bits-per-second data rate of this interface. I have installed a set of switches to let me select data rates of 300, 600, 1200 and 2400 bits-per-second for the cassette interface (but for cassette tapes, 600 bps is the limit). The clock for the cassette interface is derived from the video divider chain. Pin 2 of U57 is the clock input to the cassette interface. It is normally tied to pin 14 of U59 - setting the 300 bps rate. By tying it to pin 11 of U30, the rate increases to 600 bps (be sure to disconnect it from pin 14 of U59; if you tie the outputs of the video divider chain together, you will lose the video). Simwill lose the video). Sim-ilarly, moving it to pin 12 of U30 gives 1200 bps, and pin 13 of U30 gives 2400 bps. I use the printer at its maximum rate of 1200 bps, with pin 2 of U57 tied to pin 12 of U30. I have not had any problem with errors even though this is the printer's highest rate.

Finally, some comments on the 82A printer itself. It seems to be solidly built, and the feed mechanism is strong enough to provide a good pull with friction feed or tear out the sprocket holes with tractor feed paper. The print qualaty is crisp and clear. I was disappointed in two things, however. Though data advertises "fully Okiaddressable dot graphics" the only graphics are TRS-80 style The adverblock graphics. tisement apparently refers to the ability to change the character generator (a 2716) to a user-defined character set, but no instructions for this are provided. The TRS-80 graphics provide medium resolution, using the compressedprint and 8-lines-per-inch modes (31 dots per inch horiand 8-lines-per-inch zontal by 24 dots per inch vertical). The other disappointment is that the tractors are not adjustable in width. They are fixed at a standard 9" center, for 9-1/2" wide paper.

٥

In summary, this interface provides a cheap and simple way to provide your ClP or other computer with a printer. The most expensive item in the interface is the DB-25P plug.

REAL ERROR MESSAGES for the OSI Cassette Assembler

by: Kerry Lourash 1220 North Dennis Decatur, IL 62522

Here's a patch to the OSI cassette assembler that prints error messages instead of numbers. I call it REM (Real Error Messages). It's a little over one page long and could be placed immediately after the assembler at \$1391.

There is a short block of code at \$0590-05D2 that prints line numbers and error numbers. By patching into this area, it's possible to anticipate when an error number is about to be printed and substitute a more informative message.

To patch REM into the assembler, change \$0590-0592 to a jump to REM. If REM is located at \$1391, the contents of the start-of--assemblerworkspace pointer (at \$12C9, CA) must be changed to \$14BE, so that REM isn't overwritten by assembler lines.

The messages may seem a bit abbreviated, but I wanted to keep the length of the message table down to one page. Hope this addition will make your sessions with the assembler more pleasant. I'm currently working on an editor and other improvements for the assembler.

I think REM will also work

with the disk assembler, although I wasn't able to try it. I'm not sure where the disk assembler workspace is located, but I know REM can't be placed at \$1391.

SORTED DIRECTORY FOR OS65D 3.0

by: Jeff Easton 9416 Washington Brookfield, IL 60513

Have you ever wished that when you booted a disk and displayed the directory it would be already sorted so that at a glance you could tell what tracks were available? You could use the standard OSI program, 'DIRSRT', to do it but this program only displays your sorted directory on the screen.

On most of my disks I use the Aardvark BEXEC* that runs a directory on bootup so I thought, why not have the directory come in all ready sorted? I had two choices, either rewrite BEXEC* so that it sorts the directory before displaying it or write a program to sort the directory and store it on disk in sorted form. I chose the latter because with the other method I would have had to wait 25 seconds for the directory to sort every time I wanted to see it. The listing below is the program I wrote to do the job.

Before we get to the program let's take a look at how OSI utilizes a directory. Track 8 sectors 1 and 2 contains the directory file (track 12 for minifloppies). When you run the program 'DIR' it calls sectors 1 and 2 into the directory buffer at \$2E79. Unfortunately the buffer is only one page long so your programs have to call in the directory file one sector at a time.

Once the desired sector is in the buffer the program reads out its contents by using peeks. To add an entry into the directory file the program must first load the directory file into its buffer then find an open space to place the name by PEEKing the buffer until a string of nulls is found. Once a place has been located, the program can POKE the name and track range in the buffer and save the buffer contents back on disk. The track range is encoded into a 2 byte hexadecimal number that follows the name in the file. To see exactly what the file looks like if you have a video system type DISK!"CA D200=08,1" (for mini floppies DISKI"CA D200=12,1"). type This will bring in the first sector of the directory file to the screen memory. Notice that the two characters following are not track numbers but encoded versions of the track ranges. Therefore to decode the hex numbers (displayed as graphics characters in the above demonstration) into usable track ranges we will use the FNA function. Once the file is sorted we can use the FNB function to re-encode the track ranges for storage back on disk. See lines 30 and 40 in the listing to see the definitions for the FNA and FNB functions.

Now let's take a look at the program below. Lines 30 and 40 define the BASIC functions FNA and FNB. The variable N will be used as the array counter. P equals the decimal value of \$2E79, the beginning of the directory buffer.

Lines 1000 to 1070 read the directory sectors into the buffer one at a time, where the contents are read out to the arrays. The names are converted from ASCII by the use of the CHR\$ function and stored in the array A(N). The track ranges are decoded and stored in the arrays A(N) and B(N) where A(N) = the beginning track of the file and B(N) = the ending track of the file.

Lines 2000 to 2140 take the arrays and sort them by track. The sort routine here and in lines 3000 to 3110 parallel the sort routines found in OSI's utility DIRSRT.

Lines 3000 to 3110 take the arrays and sort them by name.

Lines 4000 to 4120 take the sorted arrays and POKE them back into the directory buffer and then save the buffer back on the disk. The rest of the directory is filled with nulls (#).

There are actually three versions of this program below. The main listing is for 8 inch disk systems. For those of you with a minifloppy system, add the lines shown. And for those of you that have imple-mented 'Stretch' Manley's 14 character file names mod, described in the June '81 PEEK. I have included the additional lines needed. CAUTION! Do not use the 14 char. version of this program on any disk set up for 6 char. file names. To do so will crash the disk. The reason is that part of the mod includes moving the BASIC overlays from sectors 3 and 4 ' to sectors 5 and 6 so that this space can be used for additional directory file-names. If you use the 14 char. version on a 6 char. disk the program could load the BASIC overlays, try to port them and caue them back sort them, and save them back on disk in the form of garbage. I have all three ver-sions running in OS65D 3.1 thru 3.3 with no problems.

You might want to add a subroutine to print out the sorted directory before storing it back on disk. I chose not to include this to keep the speed of the program fast.

cont. page 6

OSI

AARDVARK NOW MEANS BUSINESS!

WORD PROCESSING THE EASY WAY-WITH MAXI-PROS

This is a line-oriented word processor designed for the office that doesn't want to send every new girl out for training in how to type a letter.

It has automatic right and left margin justification and lets you vary the width and margins during printing. It has automatic pagination and automatic page numbering. It will print any text single, double or triple spaced and has text centering commands. It will make any number of multiple copies or chain files together to print an

entire disk of data at one time. MAXI-PROS has both global and line edit capability and the polled keyboard versions contain a corrected keyboard routine that make the OSI keyboard decode as a standard typewriter keyboard.

MAXI-PROS also has sophisticated file capabibilities. It can access a file for names and addresses, stop for inputs, and print form letters. It has file merging capabilities so that it can store

and combine paragraphs and pages in any order. Best of all, it is in BASIC (0S65D 51/4" or 8" disk) so that it can be easily adapted to any printer or printing job and so that it can be sold for a measly price. MAXI-PROS - \$39.95

NEW-NEW-NEW TINY COMPILER

The easy way to speed in your programs. The tiny compiler lets you write and debug your program in Basic and then automatically compiles a Machine Code version that runs from 50-150 times faster. The tiny compiler generates relocatable, native, transportable machine code that can be run on any 6502 system.

It does have some limitations. It is memory hungry - 8K is the minimum sized system that can run the Compiler. It also handles only a limited subset of Basic - about 20 keywords including FOR, NEXT, IF THEN, GOSUB, GOTO, RETURN, END, STOP, USR(X), PEEK, POKE, ,=,*,/,(,),(,),(,),(,), Variable names A-Z, and Integer Numbers from 0-64K.

TINY COMPILER is written in Basic. It can be modified and augmented by the user. It comes with a 20 page manual.

TINY COMPILER - \$19.95 on tape or disk

THE AARDVARK JOURNAL

FOR OSI USERS - This is a bi-monthly tutorial journal running only articles about OSI systems. Every issue contains programs customized for OSI, tutorials on how to use and modify the system, and reviews of OSI related products. In the last two years we have run articles like these!

1) A tutorial on Machine Code for BASIC programmers.

2) Complete listings of two word processors for BASIC IN ROM machines. 3) Moving the Directory off track 12.

4) Listings for 20 game programs for the OSI.

5) How to write high speed BASIC - and lots more -

Vol. 1 (1980) 6 back issues - \$9.00

Vol. 2 (1981) 2 back issues and subscription for 4 additional issues - \$9.00.

ACCOUNTS RECEIVABLE This program will handle up to 420 open accounts. It will age accounts, print invoices (including payment reminders) and give account totals. It can add automatic interest charges and warnings on late accounts, and can automatically provide and calculate volume discounts.

24K and 0S65D required, dual disks recommended. Specify system Accounts Receivable. \$99.95

* * * SPECIAL DEAL - NO LESS! * * *

A complete business package for OSI small systems - (C1, C2, C4 or C8). Includes MAXI-PROS. GENERAL LEDGER, INVENTORY, ALL THE PROGRAMS THE SMALL BUSI-NESS MAN NEEDS, \$299.95

P.S. We're so confident of the quality of these programs that the documentation contains the programmer's home phone number!

SUPERDISK II

This disk contains a new BEXEC* that boots up with a numbered directory and which allows creation, deletion and renaming of files without calling other programs. It also contains a slight modification to BASIC to allow 14 character file names

The disk contains a disk manager that contains a disk packer, a hex/dec calculator and several other utilities.

It also has a full screen editor (in machine code on C2P/C4)) that makes corrections a snap. We'll also toss in renumbering and program search programs – and sell the whole thing for – SUPERDISK II \$29.95 (5 1/4") \$34.95 (8").

ANDFUN, **TOO!**

BOOKKEEPING THE EASY WAY - WITH BUSINESS I

Our business package 1 is a set of programs designed for the small businessman who does not have and does not need a full time accountant on his payroll.

This package is built around a GENERAL LEDGER program which records all transactions and which provides monthly, quarterly, annual, and year-to-date PROFIT AND LOSS statements. and year-to-date PHOFIT AND LOSS statutement. GENERAL LEDGER also provides for cash account balancing, provides a BALANCE SHEET and has modules for DEPRECIATION and LOAN ACCOUNT computation. GENERAL LEDGER (and MODULES) \$129.95.

PAYROLL is designed to interface with the GENERAL LEDGER. It will handle annual records on 30 employees with as many as 6 deductions per employee. PAYROLL - \$49.95.

INVENTORY is also designed to interface with the general ledger. This one will provide instant information on suppliers, initial cost and current value of your inventory. It also keeps track of the order points and date of last shipment. INVENTORY - \$59.95.

GAMES FOR ALL SYSTEMS

GALAXIAN - 4K - One of the fastest and finest arcade games ever written for the OSI, this one features rows of hard-hitting evasive dogfighting aliens thirsty for your blood. For those who loved (and tired of) Alien Invaders. Specify system - A bargain at \$9.95

NEW - NEW - NEW

LABYRINTH - 8K - This has a display background similar to MINOS as the action takes place in a realistic maze seen from ground level. This is, however, a real time monster hunt as you track down and shoot mobile monsters on foot. Checking out and testing this one was the most fun I've had in vears! - \$13.95.

NIGHT RIDER - You've seen similar games in the arcades. You see a winding twisting road ahead as you try to make time and stay on the road. NIGHT RIDER uses machine code to generate excellent high speed graphics - by the same author as MINOS.

NIGHT RIDER - \$12.95 cassette only

THIEF - Another machine code goody for the C1P cassette only. You must use mobile cannon to protect the valuable jewels in the middle of the screen from increasingly nasty and trigger happy thiefs. Fast action and fun for one or two players. THIEF \$13.95 on C1 cassette only1

SUPPORT ROMS FOR BASIC IN ROM MA-CHINES - C1S/C2S. This ROM adds line edit functions, software selectable scroll windows, bell support, choice of OSI or standard keyboard routines, two callable screen clears, and software support for 32-64 characters per line video. one character command to switch model 2 C1P from 24 to 48 character line. When in-stalled in C2 or C4 (C2S) requires installation of additional chip. C1P requires only a jumper change. - \$39.95 C1E/C2E similar to above but with extended

machine code monitor. - \$59.95

Please specify system on all orders This is only a partial listing of what we have to offer. We now offer over 100 programs, data sheets, ROMS, and boards

for OSI systems. Our \$1.00 catalog lists it all and contains free program listings and programming hints to boot.

CASSETTE CORNER

by: David A. Jones 8902 SW 17th Terrace Miami, FL 33165

This month I wish to publicly express my appreciation to E. Morris and his string bug fix for ROM based systems which was published in the June PEEK (65). My homebrew word processor is written in BASIC and so I had to use extreme caution when editing large files until now. I replaced the BASIC 3 ROM with an EPROM and his code and it's truly a pleasure to be free of the bug. If you want to install an EPROM (2716) stall an EPROM (2716) in Ull with the fix, you must remove the inverter between Ul7 and Ull and rewire Ull pins 18 and 21. To remove the inverter, find the trace between Ul6 pin 10 and Ul1 pin 20 and make a small cut with a razor blade. Then add a jumper wire from Ul7 pin 5 to Ull pin 20. Isolate Ull pin 18 from +5v and tie it to 0v. Isolate Ull pin 21 from clock 02 and tie it to +5v. I accomplished the last 2 steps by soldering a small wire between pins 12 and 18 directly on the chip for 0v and between pins 21 and 24 for +5v and then put the PROM in the socket with pins 18 and 21 sticking out to the side. These steps are necessary as the 2716 uses logic low levels for output enable and chip select rather than the high levels the original ROM used. See Peter Hitt's letter in the August issue for more background on EPROMS and ROMS.

If you have a modem that you want to interface to the ClP/SII the most common recommendation to obtain a negative voltage for the RS232 driver is to use a 9v battery since the ClP only has a +5v supply. This isn't always necessary as pins 9 and 10 of the 25 pin modem connector quite often have positive and negative test voltages. Although this is optional, my Livermore Star (now Prentice?) does provide these voltages and the current is sufficient to be used as the negative voltage for the interface. Possibly Novation and Lexicon modems providè Wire the these voltages also. modem pin 10 to SII J3 pin (goes to R64) and cut W10 and you're in business without the battery.

Continuing last month's column on game reviews, here are my thoughts on a couple more.

AAARRRGGG -Pretzelland BASIC - \$7.95 - We like this one even though you sometimes do get the feeling the title suggests. The controls do exactly what they're supposed to do and the display matched my system nicely. The object of the game is to chase targets around the screen. Each target has a different point value. You want to accumulate the most points by catching them before they disappear. Simple, but we enjoy it. Pretzelland uses what they call a 'Standard Keyboard Layout'. Their standard is:

ESC UP CTRL DOWN

L/SHIFT LEFT

R/SHIFT RIGHT

REPEAT SHOOT

You don't have to relearn which keys do which function. I laud their efforts, however, it really seems the choice of keys was made to facilitate the programmer. By using all row zero keys it is not necessary to disable the control C routine and everything can be checked with just a PEEK. Everyone in my family prefers using the / for left movement instead of the left shift key. This way up and down movement is controlled with one hand and left and right movement is done with the other. I made this small change to my copy and I feel the game is much more playable this way.

Video Games III - Orion Machine Language - \$14.95 -Three games for the price of one seemed like too good a bargain to be true but I took the bait anyway. As is the usual case it wasn't quite true. Really 3 variations of Still, if the the same game. game is good I don't mind paying the price. These are 'Asteroid' type games and as the instructions state 'is there such a person who hasn't heard of Asteroids'? Well I'll admit that I had never played the real thing but I don't think it would be as popular. as it is if this were it. Once you fire your thrusters you're at the mercy of the keyboard scan routine and you scoring until you get about control which is not easy to do. The only way to slow down or stop is to turn around so you are flying backwards and then use your thrusters again. This usually results in not enough or too much thrust whereupon you must again turn around and use your thrusters, etc, etc. Meanwhile your op-

ponent is racking up points and laughing at your foolish-Consequently, there in the to use ness. isn't much incentive the thrusters except that when the games starts the opponents are out of range of each other so someone has to do it. Can't say that I enjoy this one very much but with a little rework it could be acceptable. The other 2 vari-ations have the same fault. Orion is very slow to process orders. It took 4 weeks to get my order and either 3 or 8 weeks to get their catalog. Ι sent 2 requests 5 weeks apart.

In my evaluations, I try to be objective and really do try to make the games work. After all I buy them with the expectation of enjoyment, not to review. If a particular game doesn't click the first time I try it, I set it aside and try again in a few days.

FDSAP - SOFTWARE REVIEW

Sometime ago we received a machine language program called FDSAP - Floppy Drive Service Aid Program, from Ken Holt of H/B Computers. I must say that this program has to be one of the best service aids for the servicing of floppy disk drives that I have seen for MA-COM/OSI computers.

A list of some of the functions are;

- Select drive A,B,C,D

- Home the selected drive

- In step the head one track .
- Out step the head one track
- Track step to track
- Set stepping rate
- Write test pattern
- Verify test pattern
- Alternating seek
- Exercise the disk

The above is but a partial list of the functions available to test and exercise the drive. While this a great program and I don't know how I did without it for so long, it does have a few minor things that could be corrected.

The first item is that this program does not format the disk in an OS65U compatible format. While this may sound trite, it is still a worthwhile utility.

The second item is something dear to all of us, ERROR 17. It has been my experience with this package that it will not find fault with a drive that gives this system error.

I have been sounding off about FDSAP's shortcomings which are few, I strongly feel that this program is one that every tech. should have. It is well written and the documentation while short is concise and appears to be written with the novice in mind. I recommend FDSAP to every technician and to anyone who feels the need to keep a check on the performance of their system.

For availability and cost contact Ken Holt at H/B Computers, 217 E. Main St., Charlottesville, VA 22901

TMAKER-II Our CP/M VISIble CALCulator

by Al Peabody

We were very excited when Lifeboat Associates recently announced the availability of TMAKER/II, an "electronic spreadsheet" program which will run on OSI computers with CP/M. Through the cooperation of Lifeboat, we were able to obtain a copy to review for you.

Now we have tried it, and we are even more excited. Turns out, T/MAKER II does much more than make tables.

Here's how it works. First you must configure the program to your system (more about that later), then use a very powerful editor to type in a table or **any other** text file. The file may include equations which will cause certain lines or columns to be calculated from other lines or columns, but it doesn't have to.

Next, you type in "compute" and the equations are applied to the values in the table, producing the desired new figures, which are nicely formatted, with commas and decimal places where you want them, and all lined up.

Finally, you "clean up" your

table, removing the equations, and print it out. What started out as, perhaps, your budget for the month or your profit/loss statement, with just the raw data entered, now is nicely formatted, with totals drawn, expenses subtracted from income, percentages calculated, changes, percent of change, maximum, minimum, etc., etc. all neatly indicated.

So much for the "normal" use of TMAKER. Don't get me wrong. If the program did no more than that, it would be well worth the price. But like I said, it does much more.

First of all, the full-screen editor included in the package to let you type in tables is fantastic, just short of Word-Star. It accepts text, moves lines or blocks, finds and replaces, inserts, deletes and does all that fancy stuff the other word processors do, including justification of text.

Secondly, there is a sort program which will sort all the lines in your table (file) in either numeric or alphabetic order, based on any location on the line (maximum line length 300 characters). So for example, you could use T/MAKER II to type in your list of names and addresses, always putting the names first, then addresses starting at the same position on the line, then zip code, again always starting at the same position.

Now type "sort 1 30" and in a flash your name file is sorted by the first 30 characters on each line (the names). Make a copy of the file, load it and type "sort n 70 75" (assuming the zip codes start at position 70 on each line) and quick as a wink you have a zip sorted name list. Super. And we haven't even gotten into the mathematical abilities of TMAKER!

Wait, there's more. Who says math is only useful for tables of numbers? One of the things T/MAKER II can do is count. Add just one marginal notation, and while it is generating your alphabetical name list, T/MAKER II will count the names on the list. With just a little more effort, you could count names with positive balances due, or names west of the Mississippi, or ...whatever your imagination can dream up.

But where T/MAKER II really

3281 Countryside Circle Pontiac Township, Michigan 48057 (313) 373-0468

shines is in what it is designed for -- making numerical tables. I have been working with it for weeks, and haven't come close to the limits of what it can do.

There is room for 7 equations down the left margin, with the results of any calculations being usable as the inputs to new equations (like the total expenses become a minus in the equation for net profit).

Equations adding (or subtracting or dividing or multiplying or averaging or counting or whatever) across the page can be applied to every line, to every line which was not produced as the result of another equation, to every line which was produced as the result of another equation, to just the next line, or to all the lines until you tell it to stop.

You can even use T/MAKER II to make tables too wide for your screen and printer. As you move the cursor over to the right edge of the screen, it all shifts left, so what you see on the screen is a "window" into a part of your table.

Then, when you print the table out, just let T/MAKER II know where you would like to break the table (preferably between two columns), and it will print out the left half, then the right half on the next page, ready for you to paste together!

Then there is the macro capability, in two flavors. If you find you are entering the same sequence of keystrokes over and over, you can guickly define them as a "macro" and re-enter them by striking a single key.

The second flavor of macro works like this: enter your monthly financial statement or projection, then on the very top line, type something like:

"save compute clean print"

Now return to the command mode by typing Ctrl-Q (for quit), and respond to the standard prompt ("What next?") by just typing DO. T/MAKER II will first save your file, then do the computations, then remove the formulas and line up the numbers, then print it out. If you had typed "save compute clean print get filename edit," T/MAKER II would even print out one version, then present it to you for editing, so you could see what would happen if sales went up 10% or inflation were 3% higher or whatever.

In short, T/MAKER II will do whatever you want it to do.

With a program (really a whole programming system) this complex, the manual had better be good. Good news. It is. It could be better, but it is good. It is divided into sections: initializing the system, a tutorial, and a reference section. There is even a little cardboard quick reference section you can keep with the disk to help you remember all those commands.

Problems? Sure, every system has problems. The main problem with T/MAKER II is that it is so powerful, so comprehensive, that it is somewhat frightening to start using.

First of all, there is that initialization process. You have to go through a whole menu, each selection in which leads to another menu or long list of questions, just setting up the system for your particular terminal type, which keys you want to use for cursor movement, character delete, insert line, etc., etc.

The first 19 times I tried it, I wound up specifying the same character combination for at least two functions (keep notes, dummy), and that produced some interesting but nonproductive results.

Then, again because there are so many commands and features, it isn't easy to remember how to do things. That's where the little cardboard reference guide comes in. There are even blanks to fill in what you have changed the "standard" controls to, so by faithful use of the guide, sooner or later you become proficient. And once you are, look out! You can do most anything!

UNSTALL YOUR PRINTER

By: David Broadt Broadt Computers 548 N. Derr Dr. Lewisburg, PA 17837

Those of us who sit behind a computer keyboard for what seems like 25 hours a day, 8 days a week, learn many little tricks and interesting things about the operating systems. Most of them do not seem worthy of writing about; but

1. 52

then after telling one of these facts to someone, I find it mentioned in one of his articles in PEEK (65). I only mention this because it made me aware of the value these things can be to other OSI programmers.

So much for small talk, let's start in. I would like to explain in a little more detail the inadequate printer stalled routine in 65U. In machine code it is necessary to have timing loops within timing loops to count off several seconds. The #5 driver routine in 65U tests for printer busy in the outer loop instead of the inner loop where it should be doing the test. If busy goes low a few microseconds after the test, the system will still be tied up in the inner loop. This can deteriorate the data transfer rate to the printer; the degree is dependent on the printer's firmware.

Although POKEing 15886 with numbers larger than 12 will increase the stall delay it also reduces the data transfer rate by increasing the time of the inner loop. To illustrate this: POKE 15886,100 then output a program with LIST #5. An MX80, ML80, etc. will print very slowly. POKEing 15896,0 prevents the stall notice, but does not improve the data transfer rate.

Since I feel the stall notice is more bother than it's worth, the simple solution is to replace the timing loop with a 4C jump that locks the system in a high speed busy test as in 65D. Just POKE 15885,76: POKE 15886,7: POKE 15887,62 and most parallel printers will run significantly faster than before. Here another simple little is trick: terminate all PRINTS to (don't forget the semicolon). This will allow BASIC to continue to crunch data while the printer is printing. Now, if you are wondering about the line feeds, all you have to do is preceed each PRINT statement with another PRINT: which resets BASIC'S TAB pointer and produces a line feed. Also, put one additional PRINT at the end of the report to force the printer to line feed the last printed line.

If the editor is willing, I'll be back again with a few more tricks. Until then, happy bug hunting.

.

continued

Tech. Editor's note:

It works great, 25% faster on program listing with level 3 and Okidata SL125 and yes! please send us more tricks!

Dick

TERMINAL INDEPENDENCE AND OS-65U VERSION 1.3

By: David A. Weigle 108 N. Missouri Ave. Morton, IL 61550

One of the concepts announced with version 1.3 of OS-65U is that of terminal independence. In the reference manual discussion about the Line Editor the statement "The EDITOR is terminal independent..." is made. This is not entirely true as those of us who do not use a Hazeltine 1420 terminal (mine is an ADDS-25) have already discovered or soon will. (There is a lot of similarity between the line editing commands of OS-65U V1.3 and the WP-3 word processing package in format and orientation to the Hazeltine 1420 terminal.)

For example, Control-F is used to signal that a non-destructive cursor move to the front of the line (left-most byte) is desired. (For Extended Input Mode this signals a nondestructive cursor move to the left-most byte of the input field on the screen.) For the ADDS-25 terminal, Control-F is the forward space character. This means that it is impossible when editing a line with EDITOR or inputting data to do forward cursor movement. Entering Control-F or depressing the "->" (forward arrow) key results in the cursor being positioned at the beginning of the data field on the screen.

The following information is provided to assist in customizing the Line Editor and/or Extended Input Mode function of OS-65U version 1.3 to work with terminals other than Hazeltine and to recover the use of the commercial "at" sign ("@") and the underscore character ("_"); the "@" and the "_" are used to request line and character deletion, respectively, in the system as supplied by OSI.

Modifications to the system may be made in the programs initializing the functions (EDITOR and INP\$), through the terminal when in immediate mode or in an application pro-If modifications are gram. made in either EDITOR or INP\$, they should be made at the point these programs exit and return to the system menu. When the term "initial value(s)" is used it means the decimal number content(s) of memory location(s) following activation of the Line Editor The or Extended Input Mode. memory locations are the same for both facilities.

Memory locations 23699 and 23700 are both used to identify the delete character code (destructive backspace). The initial value of location 23699 is 127, the DELete character. The initial value of location 23700 is, 95 the underscore "_". Location 23700 may be changed (why not to 127?) to enable the underscore to be used. Location 23701 is used to identify the line delete code. The initial value is 64, the commercial "at" sign ("@"). Changing this memory location (e.g., to 5, the value for Control-E to mean "erase line") permits use of the "@" character.

Locations 23702 and 23703 contain the codes to be recognized as incoming forward space and incoming backspace commands respectively. Locations 23734-23740 contain the code(s) to be echoed to cause a forward space. 23741-23747 con Locations contain the code(s) to be echoed to cause a backspace. For most terminals these echo codes would be one character. The structure appears to provide for an echo command of up to six (6) characters. A zero (0) in a memory location denotes that the previous location was the last character in the command sequence. All of these values are contained in the terminal parameter file "CRT 0", and are placed in memory during initialization of the Line Editor or Extended Input Mode.

Location 23704 contains the code to be recognized for "toggling" between character insert/overstrike modes. The initial value is 20, Control-T. Location 23721 is used to indicate which mode is currently in effect. (See the reference manual for more information).

Location 23705 contains the code entered from the terminal to request a non-destructive cursor move to the front of the line. The initial value in 6, Control-F.

OMI MEDICAL DATA MANAGEMENT SYSTEM (MDMS)

MDMS is designed to automate patient and insurance billing for group and single physician practices. Here are some of the features of MDMS.

Smooth data entry and retrieval

- Full screen editor with formatted screens
- Fast hash function lookup by patient name
- User defined coded procedures & diagnoses

Menu selected reports

- Summary of day's transactions sorted by physician with current, month-to-date and year-todate charges, credits & write-offs
- Age analysis sorted by physician & fee source • Appointment schedule

Various billing options

- Demand or batch
- Up to 17 different insurance forms
- Private 3rd party billing

OS-DMS Master files

- Patient biographical data
- Insurance supplier data
- Patient notes (optional)
- History of transactions details

MDMS will maintain detailed transactions histories limited in length only by available disk space. Primarily for this reason the recommended minimum hardware configuration for MDMS is a C3D.

	Single site, level 1 retail price	\$2500.00
/	Manual only	\$ 25.00
	Manual & demonstration disks	\$ 75.00

DMI 407 North Division Street Salisbury, MD 21801 (301) 742-1609

Location 23706 contains the code entered from the terminal to request tabbing eight (8) character positions to the right". The initial value is 9, Control-I.

Location 23707 contains the code entered from the terminal to request a non-destructive cursor move to the rear of the line. The initial value is 18, Control-R.

The above changes address only one of the problems associated with achieving terminal inde-pendence using V1.3. Program "BEXEC2" which is for terminal setup does not provide a facility to add a terminal def-inition to the set of ter-minals currently included. (From the comments in this program one gets the impres-sion that this is the program which someday will support the addition of terminal specifications to the terminal pa-rameter file "CRT 0".) If your terminal is not one of those included in the current . parameter file, how do you go about adding it?

For the discussion which follows it is recommended that the reader refer to the "CRT Control Codes Subroutine" article in the Programmer's Reference Guide portion of the V1.3 reference manual (or a listing of program GETCRT) and a dump of the "CRT 0" file. This material will show you how terminal data is stored in the parameter file and how it can be retrieved from computer memory for use in an application program.

Each record in the CRT file contains 11 fields each 71 bytes in length. The data in all fields but the first one has the format of a series of three (3) decimal digits fol-Three (3) zeros (000) denote the end of the data string for the field.

The first field contains the name of the terminal. It is used by the terminal setup program (BEXEC2) in preparing a menu from which a particular terminal can be selected for setup.

The next four (4) fields spec-ify the codes to be used to define incoming forward and backward space commands and the codes to be echoed to the terminal to cause forward and backward spacing of the cursor. So far it seems fairly simple. Now comes the complicated part.

The next field (field #6) is named "ADDRESS CURSOR". This is a deceptively simple name. This field is used to define the control sequence to tell the terminal that the cursor is being addressed; if screen coordinates are to be x,y or y,x format; if there is a delimiter character to follow the x or y coordinates in the PRINT statement; what offset is to be added to the logical x and y coordinates to calculate the physical screen coordinate values; and, if the x and y coordinates are to be presented to the terminal as alphanumberic or numeric characters. When writing a program to add your terminal to the parameter file, once you get past determining the data for this field the rest is easvl

The first three digits specify the first character in the cursor addressing sequence and whether x, y (column, row) or y,x (row,column) addressing is used for the terminal. If your terminal uses x,y addressing, then the value you would specify is the actual code of the first command character. If the terminal coordinates are addressed as y, x then this value is to be considered as a second specified as 128 greater than the actual value.

The next three digits are interpreted as follows: If they are zero (000), then there are no more characters in the cursor control sequence (preceeding the x and y coordinate specifications) AND there are no delimiter characters required by the ter-minal in the cursor position-ing PRINT statement. If there is a value and it is less than 128, then this value is part of this cursor positioning control sequence (you may need to code several sets of values to specify all the characters making up the lead-in sequence for the cursor positioning command). If the value is 128 or greater then it is the first character of the first delimiter value.

If there is to be more than one character making up the first delimiter, the addi-tional characters are specified in a series of three-di-git numbers until all have been given at which point three zeroes (000) are coded. If there is a second delimiter to be used its values are coded next; "000" is coded when all characters comprising this delimiter have been specified.

The next two three-digit num-

bers specify the displacement to be added to the x and y logical coordinates to calculate the actual physical screen coordinates. The x-coordinate value specification is also used to identify whether the terminal expects screen coordinates to be specified as alphanumeric or nu-meric characters. If the screen coordinates for your terminal are given as alphanumeric characters, then code the actual displacement values for your terminal. If the screen coordinates for your terminal are given as numeric characters code the x-coordinate displacement as being 128 greater than the actual displacement and the value of the y-coordinate displacement as it actually is.

The remaining fields to be coded are for the commands to be sent to the terminal to clear the screen, clear to the end of the screen (page), clear to the end of line, set foreground and set background.

Now for an example of adding a terminal to the system. The following program was used to include my ADDS-25 as one of the terminals supported (note: Extended Input must be acti-vated in order for this program to run):

OPEN "CRT 0", "PASS", 1: 10

- REM OPEN PARAMETER FILE INDEX<1> = 9 : REM SET FOR 20 READING END-OF-DATA POINTER
- INPUT%1, EOD : REM READ END-OF-DATA POINTER
- INDEX<1> = EOD : REM SET INDEX FOR ADDING DATA TO 40 FILE
- 50 FOR K = 1 TO 11 : REM SET LOOP COUNT FOR 11 FIELDS 60
- READ A\$: REM PICK UP FIELD DATA ITEM
- PRINT%1, [71,"L"] A\$: REM 70 WRITE FIELD DATA ITEM
- NEXT K : REM LOOP CONTROL 80 EOD = INDEX(1) : REM GET 90
- NEW END OF DATA POINTER 100 INDEX<1> =9 : REM SET TO UPDATE FILE HDR WITH NEW EOD PTR
- 110 PRINT%1, EOD : REM UPDATE
- EOD POINTER IN FILE HEADER 120 CLOSE : REM CLOSE THE FILE
- 200 DATA "ADDS 25" : REM TERMINAL NAME
- 210 DATA "006 000" : REM INCOMING FORWARD SPACE
- 220 DATA "021 000" : REM INCOMING BACKWARD SPACE
- 230 DATA "006 000" : REM FORWARD SPACE ECHO 240 DATA "021 000" : REM BACKWARD SPACE ECHO
- 250 DATA "155 089 000 032
- 032" : REM ADDRESS CURSOR 260 DATA "012 000" : REM CLEAR SCEEEN continued

- 270 DATA "027 107 000" : REM CLEAR TO END OF SCREEN 280 DATA "027 075 000" : REM
- CLEAR TO END OF LINE
- 290 DATA "000" : REM SET FOREGROUND (N/A FOR THIS TERMINAL)
- 300 DATA "000" : REM SET BACKGROUND (N/A FOR THIS TERMINAL)

Program line 250 is interpreted as meaning this terminal uses y,x (row,column) address-ing (the first value is greater than 127); the first char-acter of the cursor addressing charcommand sequence is 27 (155 minus 128), and the second character is 89; there are no (the delimiter characters third set of digits is "000"); both x and y coordinates will need to have a displacement of 32 added to them for actual physical screen coordinates; and the coordinates for this terminal are alphanumeric (the x-coordinate displacement fourth set of digits--is less than 128).

After this program is run the terminal setup function can then be executed to make the new terminal the default terminal for the system.

LETTERS

ED:

After reading PEEK (65) a few weeks ago, I was amazed to see that someone actually liked WP-3. Since he or she liked it so much I thought I'd mention that WP-3.1 (the video version) works considerably better on the Hazeltine 1420 than the WP-3.2 that it is supposed to use. The commands are all highlighted and the screen actually scrolls both forward and backwards. We found this out entirely bv accident and if you want to stick to WP-3, you might get a copy of 3.1 and try it out.

David Robertson Fort Collins, CO 80525

ED:

A lot of people seem to be confused about how easy it is to change the name of "BEXEC*" under OS65D. Here's a short program that will handle all of the work for 8" disks. Hope this helps!

- 10 PRINT"PROGRAM TO CHANGE BOOT FILE NAME"
- 15 PRINT"OS65D VER3.2 8IN. DISK"
- 20 PRINT"..... 30 PRINT[®]FIRST LOAD PART OF
- BASIC TO \$4A00
- 35 PRINT"DISKI";CHR\$(34);"CA
 4A00=01,1";CHR\$(34)
 40 DISK!"CA 4A00=01,1"
- 50 INPUT"NEW BOOT FILE":N\$
- IFLEN(N\$)>6THENPRINT"TOO 55
- LONG" :GOTO50 60 IFLEN(N\$)<6 THENN\$=N\$+" "
- :GOTO60 70 N\$="RUN"+CHR\$(34)+N\$+
- CHR\$(13) 80 FORI=1TO11:POKEI+20004,ASC
- (MID\$(N\$,I,1)):NEXTI 90 INPUT"CORRECT (Y/N)";A\$
- 100 IFLEFT\$(A\$,1)<>"Y"THEN130
- 110 DISK!"SA 01,1=4A00/5"
- 120 PRINT"NEW BOOT COMMAND IS
 - ";N\$
- 130 END

* * * * *

Gary Kaufman Philadelphia, PA 19107 ED:

CP/M continue our То Lifeboat dialogue:

My experience with Lifeboat continues to be less than satisfactory. After writing to them and telling them I'd like my money back because of the CP/M problems, I did get a call from them saying they would send a user note detailing a number of changes that could be made to make it work more reliably - such as changing the step rate, changing the head "lift" timing, etc. Not only do all these possible changes suggest an unreliable system - but I never got the user note from Lifeboat even after their call!

WFBIOS.COM doesn't help! (I'm disappointed in you thinking that I am so much of a novice that I didn't try that!) T have now tried running Lifeboat CP/M on three C-3's - the last using Shugart drives all with similar results. did get one of Siemen's drive to run at 2 MHz some of the time.

Good idea on the pokes for printusing different serial ers on the CALOX boardl (Lifeboat told me you couldn't change the port without using DDT.)

The problem you described in your paragraph (4) sounds like you didn't use the HEX representation for the length of your .COM file.

Tom Stover Gering,NE 69341

Visa Master Charge

SOFTWARE

GENERAL LEDGER \$299.00

G/L with Cash Receipts, Cash Disbursements, and General Journal entry, Journals and print-outs plus print-outs for:

•Chart of Accounts • Income Statement

•Balance Sheet • General Ledger

All journal entries are made through a horizontal entry format, allowing entry of the following fields on each transaction:

: Description : TYPE : Date : Ref # : Acct. # : Amount :

Through use of the C/D and C/R Journals, the BANK ACCOUNT is automatically debited/credited reducing the operator action to 1/2 since only one other account # and amount must be entered. Operator action is also saved during C/D entry by automatic check number incrementation in the reference number.

A running balance of debits/credits is displayed at the bottom of the screen, permitting constant awareness of a balance/unbalance situation.

As transactions are entered, the previous entries remain on the screen for visual reference.

The description entered into the chart of accounts is displayed, for operator visual verification, each time an account # is entered on a transaction.

Two special features of the system are the KEYWORD edit and the DUP function. The Keyword Edit allows editing of transactions on any 'Keyword' (unique part) in a transaction. The 'Dup' function allows the operator to duplicate any field from the previous transaction, which remain exactly the same in the current transaction or during editing, this function is used to avoid rekeying correct parts of the transaction being edited. Both features are time saving functions.

Extra features included for the CPA using this system are:

- . "See Accountant's Compilation Report" message on all reports
- . "After the fact" payroll entries post from the General Ledger to the Payroll Section for production of employee listings, reports, and tax records

ACCOUNTS RECEIVABLE \$299.00

The Accounts Receivable may be used as a "point of entry" invoicing system. Invoices produced as cash sales, charge sales, customer payments or returns, are transacted. The credit sales are stored on disk for quick access. The Accounts Receivable provides the following features:

- . Horizontal screen display for entry of invoices
- . Prints an A/R Journal from entries
- . Customer credit check
- . Standard invoicing with the ability to calculate different discount or tax amount, if desired, on each invoice item
- . Customer lists
- . Monthly statements with interest updating
- . A/R age analysis report indicating customer name, and balance with aging for 30, 60, & 90 days . A general report writer for "User" specified reports

ACCOUNTS PAYABLE \$299.00

The Accounts Payable System may be used as an extension of the General Ledger. It provides the user with the following features:

. Horizontal screen display for making entries

- . Prints an A/P Journal
- . A Vendor listing with Vendor numbers and name . A/P age analysis report indicating Vendor name and balance with aging for 30, 60, & 90 days.
- . Detailed age analysis by invoice number
- . Vendor Statements indicating invoice number, date, amount, discount, total remittance, check number and date.
- . Prints Vendor checks for all or a specific invoice . Includes up to 10 invoices for the same vendor on one check
- . Check stub summarizes invoices being paid by listing the invoice numbers and amounts
- . General report writer allows "User" specified report production

PAYROLL \$299.00

- The Payroll System includes the following features: . Horizontal screen display for payroll entries
 - . Computes payroll with several extra deductions
 - May be used by CPA for "after the fact" payroll entries or may be posted from the G/L package • Prints the following for all or specific employees:

Payroll checks Payroll Journal Payroll Register Employee listing

Earnings list

W-2's

941 Quarterly report information

. Includes a general report writer for "User" defined reports

PLANNER EXTRA \$299.00

Planner extra is a time saving program you can't afford to do without. It is a program writer and report generator all in one. Don't confuse this package with other planers or report generators currently on the market. This one goes much further in that it actually generates program code and then executes it. Planner Extra goes far beyond the hobbiest's needs. It is designed for the professional business programmer or the serious "end user."

It can save a programmer many weeks of programming time in writing "print report" type programs which perform statistical functions or math operations across fields, with vertical or horizontal format. This package produces professionally laid out results which you will be very proud to add to your program.

The reports may be set up on the computer system and then remove the generating programs until you need them again. In some situations you may wish to leave all of the programs in tack for the "end user" to produce his own special reports. Once generated the reports are stored in their own 2k disk file and recalled, for change or addition of new reports. This program will run on any OSI 8" or hard disk based computer under Level I or III. The Planner Extra is currently installed in a four year college with a five user C3-C performing all of the schools accounting, student files, payroll, accounts payable, accounts receivable and much more. The school produces reports such as budget analysis, period comparisons, conditional journals, department and budget reports for audit information, student record conditional reports and a variety of other reports from the files on the system.

Your imagination is the primary limitation to this package. There are virtually thousands of uses for the Planner Extra package. A few such uses are: journals, budgets, cost accounting, comparison charts, probability tables, stock trends, grade averages, statistical analysis, audit reports, payment schedules, interest schedules, and most any report that involves conditions, statistics, math formulas, constants, or percentages with vertical or horizontal format.

The possibilities are too numerous to list. No other program can even begin to compare to the features of Planner Extra.

FEATURES

- Produce complicated math operations across fields
- Produce results in non-existant fields which you specify and name.
- Math operands : +,-,/,*,(,),constants.example: 6=(5+2)-3*4)/1+(100) where the numbers 1-5 are existant field numbers, 6 is a non-existant field and the (100) is a constant.
- Up to ten lines of formulas can be entered to perform operations across fields.
- Conditions can be tested on any part of a field, entire field or even '&' sign for don't care. (condition on 3rd. and 4th character of a field.
- Condition specifier's: (,), (=,) =, (), =, between two limits.
- Unlimited file size, number of records, up to 40 fields per record.
- Record to record functions: Sum, sum of the product, average, and minimum-maximum.
- Vertical or horizontal format. (Horizontal max 132 characters.):
- * Specify field types:
- * Percent right justified (00.00%).
- * Alphanumeric left justified.
- * Money right justified (00.00).
- * Integer & floating point.
- * Unlimited numbers of reports. (2k disk file ea.)
- * Quick and easy set-up with screen prompting and error reporting.
- * Floppy or hard disk based, level I or III.

OS-65U UTILITIES

VARIABLE TABLE MAKER: \$25.00

Searches the basic program and produces a list of all variables and the line number in which they are located.

SEARCH VARIABLE TABLE: \$25.00

A handy programmer's tool for finding any part of a program. It lists the line number of every occurrence of a specific command, variable, string, remark, print statement or any other part desired.

DISK HANDLING ROUTINES: \$99.00

Never key in another disk handling routine. The following routines can save the programmer hours of time producing and modifying code. They contain all of the necessary code for opening files, inputting from disk, printing to disk, or searching for a string with the "find" command.

٤

All routines are DMS compatible and are stored in a disk file for quick merging into your basic program as needed If you are just learning the OS-65U operating system, writing your first multi-user programs, or just need a good standard format for the DMS file handling, then these routines are just what you need.

The routines all share common variables and set flags for different optional file handling needs such as timesharing file locking or when to close. Each routine can handle opening and closing, input and output, string searches, or time-share locks of each and all of your files. The user only sets the variables and flags, and then, GOSUB to the routine.

The flags will determine whether a file will be left open or locked. All file header information is contained in memory and there are separate variables for each open file. The channel number variable determines which file is being accessed after the initial opening.

These routines will serve as a learning tool or as a quick method of programming disk handling routines.

DISASSEMBLER: \$25.00

The Disassembler program lists out the machine code from the operating system or any other part of memory. It prints headings, dates and remarks on the top of each page of the listing. It contains fields for decimal address, hex address, contents mnemonic, and a remark column.

It is a useful tool for finding out about the operating system or a machine code program. You can specify the start and end address that you want to list. Two other programs on the disk convert hex to decimal or decimal to hex.

DMS COMPATIBLE ENTRY PROGRAMS: \$99.00

These programs are set up for easy entry of data from a serial terminal using verticle or horizontal format. All that is required is that you specify the file name or disk device. These can be input on each run or set in program lines.

The horizontal format can be used on any file with a record length of less than 80 bytes. It provides for character backspace and field backspace for easy editing. Items may be duplicated from the field above by pressing the return key. The verticle format entry is similar to the DMS entry and edit in its format, except, it is much cleaner in format.

It lists each line, one under another, and the entry is made to the same line. If you back up a field the cursor moves up the screen without destroying the display. It also has character and field backspace abilities and duplication abilities.

Editing may be performed by field label search, string search, record number search, and key file search. Any record may be sent to the screen or printer or you may dump the file header labels to the screen or printer.

ED: Below, you will find a somewhat belated response to Tom øøø Westhoff's letter (June 1981, p. 11) in which he asks for help with 14 points of im-provement of the MONITOR ROM of the C4P. - The Math-extension (No. 14)

seems to be difficult, and I don't think it has anything to do with the MONITOR ROM. But the rest is o.k. with me.

No's. 6 and 7 have already been dealt with, 2 and 3 are quite simple, and I will try at No's. 1 and 4 (see assembler-listing below).

I would also like to add a No. 15: CONTROL-S for stopping the output CONTROL-Q and for resuming it. This can easily be implemented in the output routine and I think I have already seen it somewhere in PEEK.

I'll make a try at No. 10 (Os • after CR) next time, there have been some nice sugges-1øø 1øø 100 tions PEEK. 100

DMS COMPATIBLE

First of all, the music software mentioned in the January '82 issue for the C-100 sys-tems (page 1), is it the same, better, or what, when compared with the old DAC routines? Is there someone who has some really excellent routines for music for an OSI C-4P MF? Secondly, where can one find and inexpensive M.P.I. drives not from OSI themselves? Τ have seen the ad for Midwest Peripherals Computer in Kilobaud, but don't know if they are OSI compatible. Please respond. Bill Fast Clearbrook, B.C. Bill: DAC I & II from OSI play 4 part music. It also allows you to write your own music. Why doesn't someone out

I have just recently discovered your fantastic magazine. It really has been helpful. I

have a few questions about my

5-1/4" Anv soft sectored single density drive should work. If you are going to use it as the B drive, OSI doesn't use the standard floppy drive ready for the second drive. Refer to the Sams manual for the C4P. It would also be a good idea to purchase the technical manuals for the disk drives too. In reference to the M.P.I. drives, contact, Micro Peripherals, Inc., 9754 (cont. 9754

BUS-II LEVEL I BOOKKEEPING & ACCOUNTING SYSTEM The BUS-II turn-key multi-client accounting package is the leading OSI business software package. BUS-II Version 32 includes five principle modules:

	Inst. Price	List Price
GENERAL LÉDGER	\$1200	\$599
ACCOUNTS RECEIVABLE (a)	1000	599
ACCOUNTS PAYABLE (a)	1000	599
ORDER ENTRY W/		
INVENTORY (a) (b)	1000	599
PAYROLL (no extra charge for		
optional versions)	1200	799

OF DEFINITION OF THE OPERATION - CPA FIRMS & SERVICE BUREAUS - RESTAURANTS - COMMISSION SALES - CONTRACTOR'S JOB-COST ACCOUNTING 02 03 04 05

The Accounts Receivable, Accounts Payable, and Order Entry W/ Inventory are completely interactive with the BUS-II General Ledger. Two optional specialized packages (completely interactive) are also

available

vailable. CPA EXTENSIONS (see below) POINT-OF-SALE TERMINAL W/ INVENTORY (see below)

The BUS-II CPA EXTENSIONS Package provides special features for accountants and bookkeepers. The POS-I Point-of-Sale Terminal package enables the opperator to use the computer system's video terminal as an on-line "electronic cash register."

Note: BUS-11 operates on tloppy-disk or hard disk-based systems running the OS-65U operating system (single-or multi-user). Multi-client use can accommodate any number of client companies on floppy disk systems or hard disk system with H/D/E (required for hard disk use). BUS-11 LEVEL1 files are limited in size for floppy disk back-up. floppy disk operation continues in case of hard disk failure.

BUS-II "SOFTWARE EXCHANGE" SPECIAL

BUS-II "SOFTWARE EXCHANGE" SPECIAL Users of other business software packages who wish to upgrade to Digital Technology's full-function BUS-II BOOKKEEPING & ACCOUNTING SYSTEM can, in many cases, "trade in" their old, unuseable, or unsupported software for full rebate of the original purchase price (up to \$750.00). This "SOFTWARE EXCHANGE" offer includes virtually all of the previously-available OSI business software packages. Contact Digital Technology or your dealer for more information.

BUS-II LEVEL II (EXPANSION TO BUS-II LEVEL I) BUS-II LEVEL II is designed for much larger businesses. Expanded file size and special operations allow virtually unlimited numbers of accounts and transactions. BUS-II LEVEL II requires BUS-II LEVEL I, Minimal back-up is data cassette (tape) or floppies--although multiple Winchester disk operation is recommended (provides ability to continue computerized bookkeeping functions in case of hard disk failure.) H/D/E Hard Disk Executive is required.

	Inst. Price	List Price
GENERAL LEDGER (c) (d)	. \$	\$399
ACCOUNTS RECEIVABLE (c) (d)	600	399
ACCOUNTS PAYABLE (c) (d)	600	399
ORDER ENTRY W/		
INVENTORY (c) (d)	600	399

CPA EXTENSIONS PACKAGE CPA EXTENSIONS is designed for public accounting firms. A number of special operations are provided: "bankers" Balance Sheet and Profit and Loss statement with summarization and consolidation options, Statement of Changes in Financial Position, Statement of Changes in Components of Working Capital, Cash Flow Analysis, Departmentalized Sales Analysis, Asset Depreciation Schedule (compatible with TAXMAN-1040), and Loan Amorization Schedule. In addition, a pre-processed or "after-the fact" payroll system is provided.

CPA EXTENSIONS is interactive with BUS-II 32 BOOKKEEPING & ACCOUNTING SYSTEM CPA EXTENSIONS (a) Inst. Price \$2400 List Price \$1500

POINT-OF-SALE TERMINAL

POINT-OF-SALE TERMINAL. POS-1 is an on-line multi-store point-of-sale terminal program with integrated inventory designed for cash register emulation. POS-1 controls cash drawer and licket printer (or system printer). Automates taxable or nontaxable sales, cash transactions, and credit sales (with verification operations). POS-1 also allows the use of industry-standard bar code readers with the point-of-sale terminal system through a "Samese port- on the C2 or C3 CPU card (Extra senai port NOT needed except in multi-user operation.) Configured for industry-standard RS232 bar code "wand" (INTERMEC) or "window" (SPECTRA-PHYSICS).

POS-1 is interactive with the BUS-II V 3.1 BOOKKEEPING & ACCOUNTING SYSTEM.

POS-1 POINT-OF-SALE TERMINAL (a)(b) Inst. Price \$1600 List Price \$1199

TAXMAN-1040 PERSONAL INCOME TAX PREPARATION TAXMAN-1040 is designed for tax practitioners and public accountants. TAXMAN-1040 is the leading tax package for OSI micorcomputers--the package has been installed on OSI, Hewlett-Packard, DEC and IBM systems. Designed and supported by CPA tax experts. This package automatically prepares FORM 1040 and 32 schedules. Support includes annual forms, tax tables, and compu-tational revisions in accordance with Federal Tax Law changes. Inst. Price \$3600 List Price \$2399 TAXMAN-1040

Digital Technology, Inc., is the largest independent supplier of OSI software with hundreds of business packages in use around the world. Digital Technology software is sold by a growing number of conscientious OSI dealers and CEME. Every package is backed by the linest support program in the microcomputer industry. All Dug3 are fixed free of charge. Updates (fixes to bugs, minor enhancements, new product announcements) are provided to all backers and linesmed users tree of charge. And upgrades to new versions are encouraged (at nominal charge). Digital Technology software is user-obtained. In foct, no one elles provides such expansive features as on-line documentation, idio-proof prompting, and operator's manuals that are comprehensive, distaled, and accurate. All Digital Technology software systems allow the operator to "sel" the programs to the type of vedo lerminal and printer user. The portied is the imminal and printer types from the ists provided in the "TERNINAL & PRINTER OPTIONS" program. Spreen formating and printer control are provided automatically yet may be redefined through user subroutines.

H/D/E HARD DISK EXECUTIVE

H/D/E HARD DISK EXECUTIVE Digital Technology's implementation of H/D/E is the answer to AMCAP's HDM. Digital Technology's H/D/E provides user functions not found on HDM of similar products: ability to copy from any user "system" to another: automatic recovery in case of "back-up to floppy" or "restore from floppy" utility failures, allowing the user 3 options: (1) ignore error. (2) abort to menu. (3) try again, use of both "A" and "B" floppy drives to back-up hard disck flies; and automatic back-up to diskette initialization. H/D/E opreates on any OSI Winchester disk system from 7-80 megapytes. Re-use of hard disk space is provided. Superior to AMCAP's hard disk manager in every respect (and Digital Technology software does not self-destruct). NOTE: H/D/E is required when installing any Digital Technology business applications packages on OSI hard disk systems. H/D/E HARD DISK EXECUTIVE List Price \$399

OS-DMX DATABASE MANAGEMENT SYSTEM Command-oriented OS-DMS compatible database management system OS-DMX operates under the OS-65U VI.2 operating system (single- or multi-user). Features such as control files, extensive operating commands and the innovative HELP function, make this one of the most usable--as well as powerful--systems available for microcomputers. OS-DMX may be used instead of, or in addition to, OS-DMS Nucleus, Query, Sort; OS-DMX will replace virtually all of the specialized OS-DMS modules-- and in most applications will provide greatly improved performance.

provide greatly improved performance. OS-DMX Database Management System buyers will receive (no extra charge) a number of "extras" previously sold separately: DMX-MAIL DMX-MAIL Comprehensive Statistical Analysis package (JULY 82) DMX-COPY Edit Database Structure after the fact (FEB 82) DMX-MERGE DMX-MERGE File Merge Operation (FEB 82) DMX-TUTOR 450-Pg futorial w/ Demo Data Diskette (AVAILABLE)

(AVAILABLE) In addition, DMX-SORT operations will be upgraded to machine-code sorting for faster operation. There will be no need to purchase high-speed sort programs separately. OS-DMX DATABASE MANAGEMENT SYSTEM Inst. Price \$1600 List Price \$1199

BISYNC-80/HASP is a full-function Multileaving Workstation package which allows communication with any remote CPU that supports a HASP Multileaving Workstation, and, as such, is ideally suiled to Remote Job Entry applications. OS-BISYNC-80/HASP (e)(f) List Price \$1195

BISYNC-80/3270 BISYNC-80/3270 is a full-function IBM 3270 terminal emulator which allows the microcomputer to communicate over point-to-point telephone lines with any IBM S/360, S/370, or S30xx CPU that provides standard IBM support for one of the following: IBM 3275 Model 2 IBM 3271 Model 2 or control unit w/ attached 3277 Model 2 IBM 3274 or 3286 printer Distribution 2020 (2010) List Price \$895

OS-BISYNC-80/3270 (e)(f)

BISYNC-80/3780 BISYN-80/3780 is a full-function IBM 2780/3780 emulator allowing Bis tread/or and is a function fam a rook of the microcord emotion allowing the microcomputer to communicate over point-to-point telephone lines with any CPU or device that provides standard IBM support for: IBM 2780 Models 1, 2, 3 or 4 IBM 3780 w' or w/o 3781 card punch IBM CPU to CPU BSC communications

List Price \$895

List Price \$895

OS-BISYNC-80/3780 (e)(f)

BISYNC-80/ASYNC BISYNC-80/ASYNC is a full-function asynchronous communications package which allows microcomputers to communicate asynchronously with a mainframe or other microcomputers. This package is an ASYNC adaptation of BISYNC-80/3780 terminal emulation program, providing asynchronous communications at 75 to 9600 baud, using full IBM BISYNC protocol. List Price \$195 OS-BISYNC-80/ASYNC (e)(f) List Price \$195

OS-BISYNC-80 SYNCHRONOUS

digital technology

P.O. BOX 178590 SAN DIEGO, CA 92117 (714) 270-2000

done this? Does anyone know anything about the 710 CPU expander or the software to go | with it? Can anyone tell me how to get new or updated manuals. My OS-65U manual, what there is of it, says Vl.1, June 1978. After getting the 36MB hard disk I was somewhat surprised to learn that no utilities are provided to copy files from one system to another or to back up a full system on floppies, you can buy these separately but almost anyone using a hard disk will need these utilities so why not include them with the system and in-crease the price a little. Also, anyone who has used PIP under CP/M or FID on an APPLE will understand just how much better OSI's utilities could be. After so many problems with the utilities I was not too surprised to find that the RENAME utility does not check to see if the new name exists. If anyone wants the Tech. letters put out by OSI, I was able to get a complete set (1-28) from Data Products Maintenance Corp., 9460 Telstar Ave., El Monte, CA 91731 10 REM INDIRECT COMMAND FILE GENERATOR 20 REM 30 REM 40 REM 50 REM This program sets up BASIC command files. 60 REM 70 RV = 128 : CL\$ = CHR\$ (26) : MI = 11657 : MO= 11661 80 POKE MI,0 : POKE MI + 1,RV : POKE MO,0 : POKE MO + 1,RV 90 PRINT CL\$; SPC(25);"I N D I R E C T I O N" : PRINT 100 POKE 2976,13 : POKE 2972, 13 : REM GET THEM THAR COMMA'S AND COLONS 110 INPUT "(F)ile or (K)eyboard Run";TY\$: DIM A\$(100) : PRINT 120 IF TY \$ < > "K" AND TY\$ < > "F" GOTO 110 130 IF TY\$ = "K" GOTO 220 140 INPUT "File Name ";NF\$: OPEN NF\$,1 : FOR IN = 1TO 100 150 INPUT %1,A\$(IN) : IF A\$(IN) <> "OK" THEN NEXT IN 160 CLOSE 170 PRINT : INPUT "Do you wish to check the file";A\$: IF A\$ = "N" GOTO 330 180 FOR X = 1 TO IN : PRINT X,A\$(X) : NEXT

OSI Disk Users

Double your disk storage capacity Without adding disk drives

Now you can more than double your usable floppy disk storage capacity—for a fraction of the cost of additional disk drives. Modular Systems' DiskDoubler™ is a double-density adapter that doubles the storage capacity of each disk track. The DiskDoubler plugs directly into an OSI disk interface board. No changes to hardware or software are required.

The DiskDoubler increases total disk space under OS-65U to 550K; under OS-

65D to 473K for 8-inch floppies, to 163K for mini-floppies. With the DiskDoubler, each drive does the work of two. You can have more and larger programs, related files, and disk utilities on the same disk for easier operation without constant disk changes.

Your OSI system is an investment in computing power. Get the full value from the disk hardware and software that you already own. Just write to us, and we'll send you the full story on the DiskDoubler, along with the rest of our growing family of products for OSI disk systems.

Modular Systems

Post Office Box 16 D Oradell, NJ 07649.0016 Telephone 201 262.0093

BASIC THAT SCREAMS

Is the sedate pace of OSI BASIC taking the fun out of your programming?

Then turn your system on to FBASIC! Now you can compile your programs with FBASIC and take full advantage of your computers potential.

FBASIC is extremely fast. Allowing you to do unheard of things in BASIC. Things that cannot be done in any other language except assembler, with no need to learn a new language.

For the example program:

- .10 FOR I=1 TO 60000
- 20 A=A+1
- 30 NEXT I

FBASIC produces a machine code equivalent, which, including the runtime package is less than 400 bytes, and executes in *less than 4 seconds*. (1 MHz clock).

The secret to this incredible speed is that FBASIC is an integer subset of BASIC that produces *native 6502 machine code*. With no run-time interpreter to get in the way of all-out machine performance.

FBASIC is good for almost any application, from wordprocessors to video games. What ever tickles your fancy.

FBASIC accepts standard BASIC source files and produces executable disk-based object files. It includes many new features such as hex constants, convenient machine-language calls, optional user selection of array locations, direct access to processor registers, and more.

FBASIC also includes a Crossreference utility which produces a complete sorted list of all line and variable references within a program. The Cross-referencer was written in FBASIC and takes less than a minute on even the largest program (written in OSI BASIC it would take upwards of an hour and a half!).

So let that pent-up performance out! Find out what your machine is really capable of. Feed it some FBASIC and stand back!

FBASIC runs under OS-65D and requires 48K.

Available on 8-inch diskette for \$155 including postage. Cross-reference only \$25.

> Pogasus Software P.O. Box 10014-P Honolulu, Hawaii 96816

Mike:

Ohio Strav writes on Scientific Hard Disk Multi User Computers have been a problem for a long time. Fortunately, Joe Linden of Four State Micro Computers, P. O. Box 1446, Joplin, MO, offers a solution. Send him \$50 and he will send you a pair of disks with a matched and fixed system and set of utilities which will cure your problem.

It appears that M/A-COM OSI has placed the 710 CPU on the back burner while they work on more pressing problems.

There are no updated manuals for OS65U version 1.1 and 1.2, but there is a new (much better) manual for version 1.3. See your dealer.

Projects, Inc., 20 Mountaintop Farm, Charlottesville, VA, has a set of utilities called the H/D/E which will copy a file or a system from the hard disk to the hard disk or to floppy. Will restore files or systems from floppies to the hard disk. Will create or rename subsystems and has modified CREATE, DIR and PACKER programs which self configure to the size of the hard disk subsystem. The H/D/E sells for \$595 and DBMS will not sell any hard disk computer without one.

Dick Tech. Editor

ED:

The DQFLS WP6502 version I am using is 1.2; I used to have 1.3 but I turned that in for a refund some time ago (and purchased 1.2 instead). Reason was, that the program interacted with my Hazeltine 1520 SO BAD, that it became a matter beyond frustration.

Meanwhile, a friend of mine, also using a Centronics 737 (but a Hazeltine 1500), has V1.3, and I've been playing with it at his place, and yes, I agree, it does right justify on the Centronics, but ONLY when you select 1. (NEC) rather than 2. (Other) from the menu following the copyright notice, and then ONLY with the Default or Condensed font. We've tried everything and cannot get it to work right with the proportional font, where I really wanted it. So back to V1.2, which I think is a darn good piece of software.

When I had my 1.3 (before I turned it in), there were two major things wrong. 1. Upon bootup, it sporadically (almost often) categorically refused to boot (I'd get Drive A not ready, Drive B not ready, and it clunked a little and that was it); I finally solved this to some degree by refreshing the system (initializing from 0 to 25087 and copying a standard OSU system onto it! I have a hunch (but only just that) that Dwo Quong was using a faster processing speed, but it didn't dawn upon me to change it at that time with the applicable poke).

[Do you mean the floppy disk drive stepping rate, PEEK (11895)? ...AL]

Whenever I used proportional font in conjunction with #N27 etc., and such decimal codes as 17, 19 or 20 for font selection, or 14 and 15 for e-

longated (the standard Centronics repertoire of printer control codes) my Hazeltine would go into format, and either hang or print crap on the screen, messing up what I had in memory. Sometimes the Terminal reset would get me back to the WP menu, but sometimes I just couldn't get out of the mess. This hapout of the mess. pened when the board switch for the terminal was on tilde or escape, either way, it seemed to make no difference. I don't have this problem with V1.2! Then when trying to print out the ostensibly justified proportional text on the Centronics, I'd get Dwo Quong tokenized basic (or whatever it was) on the printer.

I've had long discussions about this with Joseph Ming and talked to Fred Beyer as well, at Dwo Quong, but my final decision was to trade down to VI.2; which has been a regular work-horse around here.

Your DBMS INC's Terminal Extension Package does indeed allow me to use some of the specialized features of the Hazeltine 1520, but it's only the tip of the iceberg, I think.

Parenthetically, I think I mentioned to you that I had returned my OS-CP/M disks to OSI for upgrading (since there were disk errors on them that could not be fixed). To my very great surprise and relief (particularly since I had not gotten a Return Authorization beforehand), they did (after some phone calling) send me an updated copy of V1.4 with some fixes on it dated in 1980. I'm really not experienced enough to figure out what these

SMART TERMINAL SOFTWARE For OSU Serial Systems ---- by Jim Sanders "Sanders' Software Works!"

Now Available for OS 65-U serial systems ... A complete modem Communications package! Very easy to use, and contains a full range of keystroke controls for duplex, delay, file handling, protocols and other goodies. You can send and receive programs and data files, or just chat with other computers. In use daily for remote batch and interactive work with IBM and CDC mainframes. The program includes code for major OSI UART and ACIA locations, and is easily modified for any others. Send today, and open up the world! Extensive manual and 8-inch Disk ONLY \$ 27.50 J & T Associates

INCLUDES HEAVILY COMMENTED ASSEMBLY PROGRAM !!!

socketed

are, since for the most part they are in hex, and that's one of my weaker points. B they were MOST cooperative But and that's a step in the right direction for OSI (for any company for that matter)!

Also, let me state that Dwo Quong in the above matter, was most cooperative and it's too bad things turned out as they did; I sure would have liked V1.3 to work.

Fred S. Schaeffer Jamaica, NY

* * * * *

ED:

Here's a handy little Ram diagnostic somé of the readers may find useful in locating memory faults.

First, generate a tape with a routine something like this:

- 10 DIMA\$(133)
- 20 FORL=1T0133
- 30 PRINT L; TAB(5); 40 INPUT A\$(L)
- 50 NEXTL
- 60 PRINT"DATA LOADED"
- 70 INPUT"<SPACE-RETURN TO DUMP TO TAPE>";Q\$
- 80 REM- YOUR TAPE OUTPUT STATEMENT GOES HERE, POKE517,1 OR DISK!"IO 02,03"
- 90 FOR L=1T0133
- 100 PRINT A\$(L)
- 110 NEXT L
- 120 REM- YOUR TAPE OFF STATEMENT, POKE517,0 OR
- DISK! "IO 02,02" 130 PRINT"ANOTHER COPY":GOTO 60

*** DIAGNOSTIC DATA *** A9 00 85 11 85 14 A0 82 A9 80 A2 09 8D 10 D2 99 00 00 D9 00 00 D0 0E 4A CA D0 F1 C8 D0 EA E6 11 E6 14 4C 08 00 48 8C 12 D2 AD 11 00 8D 13 D2 A9 2A 8D 14 D2 A9 FD 8D 00 DF AD 00 DF C9 EF D0 F4 A9 20 8D 14 D2 A9 FD 8D 00 DF AD 00 DF C9 EF F0 F4 A9 FE 8D 00 DF AD 00 DF C9 DE F0 06 C9 7E F0 09 D0 EE 20 70 00 68 4C 17 00 20 70 00 4C 00 00 A9 20 8D 10 D2 8D 11 D2 8D 12 D2 8D 13 D2 8D 14 D2 60 . 0000 G

With the hex data loaded and the 'dump to tape' prompt on screen, roll tape in record mode, wait several seconds to <space-return>. When the dump is finished, your tape is ready to use!

Rewind, hit <BREAK> <M>, roll the tape, when you have stable input- <L>.

Interpreting the results:

When an error or end of Ram+1 is detected, the routine loops the keyboard while the screen indicates error data, bit and page with an asterisk to indicate 'halt'. The findings are displayed as the character equivalent of the hex value, thus:

@ +k* is data \$40 or bit 6 (0-7), location \$2B, page \$6B, and halted. To locate the and halted. chip, convert the page indi-cated to decimal: K (CHIP)= INT (DECIMAL PAGE/4) +1. In this example, the problem is in K-27 (610 board).

Another example:

@ #\$* would be in K-10, also on the 610 board. The bar clears the halt, The space <ESC) continues with the next bit and <repeat> restarts the entire test. You may test the video ram by loading the tine then: <BREAK> <M> /D0.0007 / 00.0000 rou-0001 <G>. The video ram test controls, presents and decodes the same as ram.

Kenneth D. Koonsman Abilene, TX 79603

* * * * *

ED:

Here is a way to simulate an IF...THEN...ELSE :

100 L=-(X=3):GOTO 200*L+300* (1-L) is the same as 100 IF X=3 THEN GOTO200 ELSE GOTO 300

Here is another one: As everyone knows, after testing N have branched to one of 2^N possible nodes in a program. For example, suppose we have the following 3 conditions: P=(X=3), Q=(Y<0)OR(X=4), and R=(Y>1)AND(X<2). Since each P,Q and R may be -1 or 0 (T or F) there are 2*2*2 or 2^3 possible ways to assign truth values to the triple (P,Q,R). The distinct states of this triple may be thought of as a binary number where the (P,Q,R) corresponds to -(4*P+2*Q+R). Here is a table of all 8 ways that this triple can be assigned truth values. Included in the table are line numbers we wish to branch to given the corresponding logic state.

Р	Q	R	Line Num
F	F	F	200
F	F	т	145
F	т	F	12351
F	т	Т	3162
т	F	F	23000
	P F F F T	PQ FFF FT FT TF	PQR FFFF FFTF FTF TTFF

OSI 65 D OSI 75 D OSI
5 T F T <u>8121</u> 6 T T F <u>56421</u> 7 T T T 9999
During the initialization phase of the program there should be something like the following:
<pre>100 DIM LN(7):FORI=0T07:READ LN(I): NEXT 110 DATA 200, 145, 12351, 3162, 23000, 8121, 56421, 9999</pre>
Then later in the program:
200 P(3)=(X=3):REM CONDITIONAL
210 $P(2) = (Y < 0) OR(X=4)$: REM CONDITIONAL O
220 $P(1) = (Y>1) AND(X<2)$: REM CONDITIONAL R
230 L=0:F=1:FORI=1T03:L=L-F*P (I):F=2*F.NEXT
240 GOTO LN(L) : REM BRANCH RE TABLE ABOVE
Clearly this can be expanded to larger number of logical variables. However, code of this type can be exceedingly difficult to debug or to up- date later unless one is most careful to write clear docu- mentation. Of course, you do this all the time anyway

Harry Suber Salisbury, MD 21801

right?

ED:

Some notes on 65D V3.3. It's a big improvement over V3.0 that I've been using. It came in a notebook the size of their systems, with 5 tutori-al disks. If you are just getting started, over 200 pages of indexed information (no disassembly or source code). Print at and print using, BASIC line editor, window definition on screen, a screen clear command, screen manipulating commands, a fix for GET command and all sorts of other goodies.

Alex J. Kowalski, Jr. South Bend, IN 46619

* * * * * * ED:

Page 12 of your November, 1981 issue, has a nice item on a port 8 driver in OS-65U. The problem outlined there is similar to the one we faced when we added a NEC Spinwriter to our C3-B (which already had a line printer.)

To avoid cable-swapping, we had a regular Centronics parallel output board readdressed to \$F500, so as to be at a different address from the usual \$F400. The following program allows switching from line printer to daisy wheel (or thimble, to be precise) without any hardware juggling. It also sets top of form and, for the Spinwriter, will change the pitch and spacing. Believe me, the convenience is worth the \$200 or so that the board costs. Alan Heinold of the Computershop, our local OSI dealer, was of great help on this.

William E. Shawcross Cambridge, MA 02238 ED:

Does your system need more memory but your power supply is already straining? I would like to suggest that you replace a few of those power hungry 2114's with ultra low power CMOS RAMS. A 6514 CMOS RAM can be plugged directly into a socket intended for a 2114. A typical 2114L draws 65 ma per chip. The CMOS ver-sion draws 10 ma during a read/write cycle, but less than 1/2 ma when not selected. One source for the 6514 is B.G. Micro, Box 280298, Dallas, TX 75228. BG's price is \$2.95 each for 350ns chips. One word of caution, the 6514 will NOT work as video memory. The chip latches the address line on the edge of the chip enable pulse. The OSI video circuits keep the chip enable constantly true.

Micro Interface (3111 S. Valley View Blvd., Suite I-101, Las Vegas, NV 89102) is offering a 56K CMOS memory board and parallel printer port. The board is populated with 6116 CMOS static RAM. These chips are 2K by 8 bits and pin compatible with 2716 EPROMS. The board is designed so that any 2K block in the memory map can be enabled.

The Micro Interface board can be purchased with a minimum of 4K to a maximum of 56K installed memory. Additional chips are easily added by soldering on more sockets and

enabling diodes. I have run a board populated with 24K for several hours with two different memory tests with no failures. The board runs with a noticable lack of heat. Only the address and data buffers run slightly warm. The 6116 memory chips are rated at 200ns. Micro Interface guarantees the board to operate at 2 Mhz although my tests were run at only 1 Mhz.

The CMOS board also has provision for a monitor ROM at \$F800 to \$FFFF. Seven of eight pages are decoded rather than 3 of 8 as on OSI boards. For those of us running the OSI 500 CPU board, this is an opportunity to replace those hard to program 1702 monitor ROMs.

Earl Morris Midland, MI 48640

Earl:

A similar board is available from OSI. There is space for 64K, but no printer port. (CM20).

3.

CROSS REFERENCE UTILITY (REF Command)

Let's face it. These days nobody has the time to plow through pages and pages of program listings looking for references to some variable, constant, or line number. But what if you can't remember where A\$ is being used, or *if* it's being used, or where T% is set, or how many references there are to line 5710?

If you're still wasting time searching for answers to questions like these, here's the relief you've been desperately needing. It's our CROSS REFERENCE UTILITY (REF Command) . . . a high-speed, memory-resident utility with versions for both 65D and 65U. Because the REF actually works on the program in memory and not one on disk, you get fast answers that save valuable time.

By entering the proper command, REF will produce either a comprehensive list of every variable or numeric constant in your program, or a list of each occurrence of any one given variable. The complete listing is presented in sorted order, and can be sent to the printer for hard-copy.

FEATURES

- High-speed, machine language, memory-resident utility available for 65D and 65U. Lists all occurrences of variables, line numbers, and numeric constants.
- Can be co-resident with utilities like EDITOR and RSEQ.
- Functions under Level III in networking.
- Easy to read display includes symbols to indicate exact nature of each reference:
 - 20 A = 1:A% = 1:A(1) = 1:A%(1) = 1:A\$ = "X":A\$(1) = "X" 40 T% = 1:A\$ = "STRING CONSTANTS ARE NOT SEARCHED. I.E. X = 1 IS NOT FOUND"

 - Entering "REF A" gives the following results: A: 20(%1 20(\$1 20(1 20/%1 20/\$1 20/1 40/\$1 80/%3 80/21
- Requires only 1K of memory. Can be loaded into high end of user memory, or under 65U, REF can be hidden in the OS area.
